

A decade of experience in fitting sports footwear helped to create world's best locking system for prophylactic and orthopedic footwear. In contrast to traditional shoelaces, the BOA binding system does not slide, and perfectly and safely fits the shoe to the foot, which ensures comfort throughout the day.

We are the only manufacturer of footwear in Poland, who won the trust of the American company BOA and implemented the production of shoes with the BOA binding system.

In prophylactic footwear, the BOA system is a combination of two types of fasteners: laces and Velcro. Shoelaces enable to fit the shoe to the foot very well, and Velcro provides fastening convenience. Unfortunately, each of these fastening methods has its drawbacks. With a BOA binding, the child can easily and correctly fasten their shoes on their own, ensuring stabilization of the ankle.

Binding BOA is available in the following models: 1000, 1003, 1011, 1015, 1017, 1018

OPEN:

Pull the wheel.
Pull the tab forward
and loosen the line.

CLOSE:

Press the wheel
and turn right.

The BOA® System with open heel

It allows people with disabilities to use footwear in everyday life in the simplest and safest way. The system enables easy operation with one hand and ensures uniform tension throughout the foot, allowing the footwear to fit perfectly.

The BOA is also designed specifically for kids who wear orthotics, so they can easily put on and take off their shoes.

The company BOA managed to obtain a perfect fit with a simple turn of a wheel, which is far from the use of excessive force, and old-fashioned fasteners. This fastener form has both a significantly higher level of comfort, and is durable, lightweight, fast and convenient to use as well. Manufacturer of the BOA fasteners gives a lifetime warranty on its products.
